

**Land Use Efficiency  
versus  
Energy efficiency  
in the context of  
climate change**

# **Main messages for agriculture in the context of Global Change**

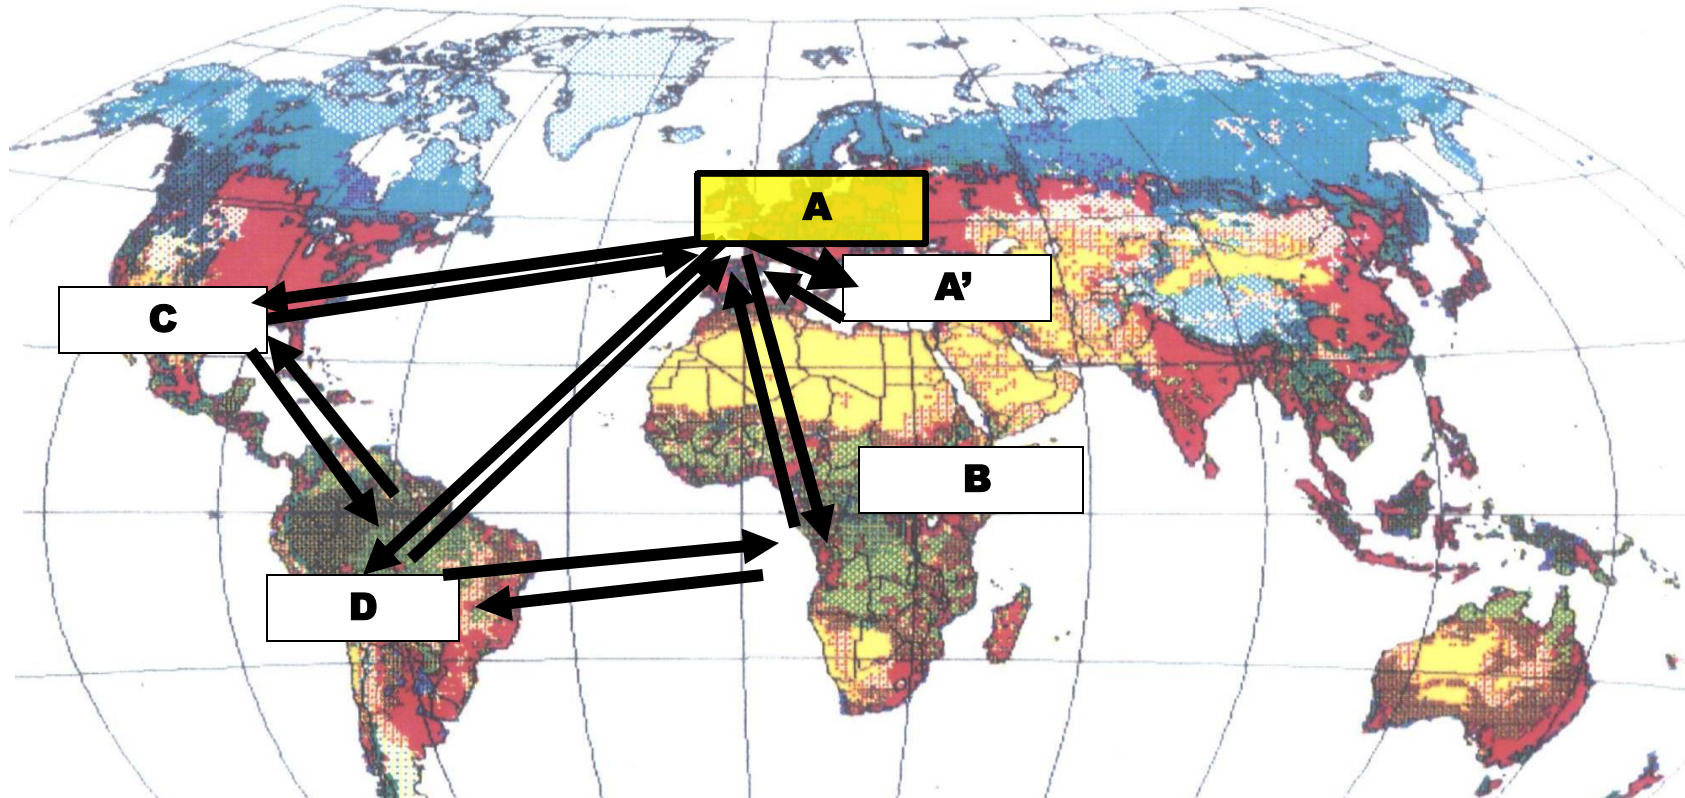

(World Population Growth and Climate Change)

**Increasing fertilization to double crop production  
is more climate friendly  
during at least 2 centuries  
than increasing cropland area**

**Increasing « Land use efficiency » is to be  
considered before increasing energy**

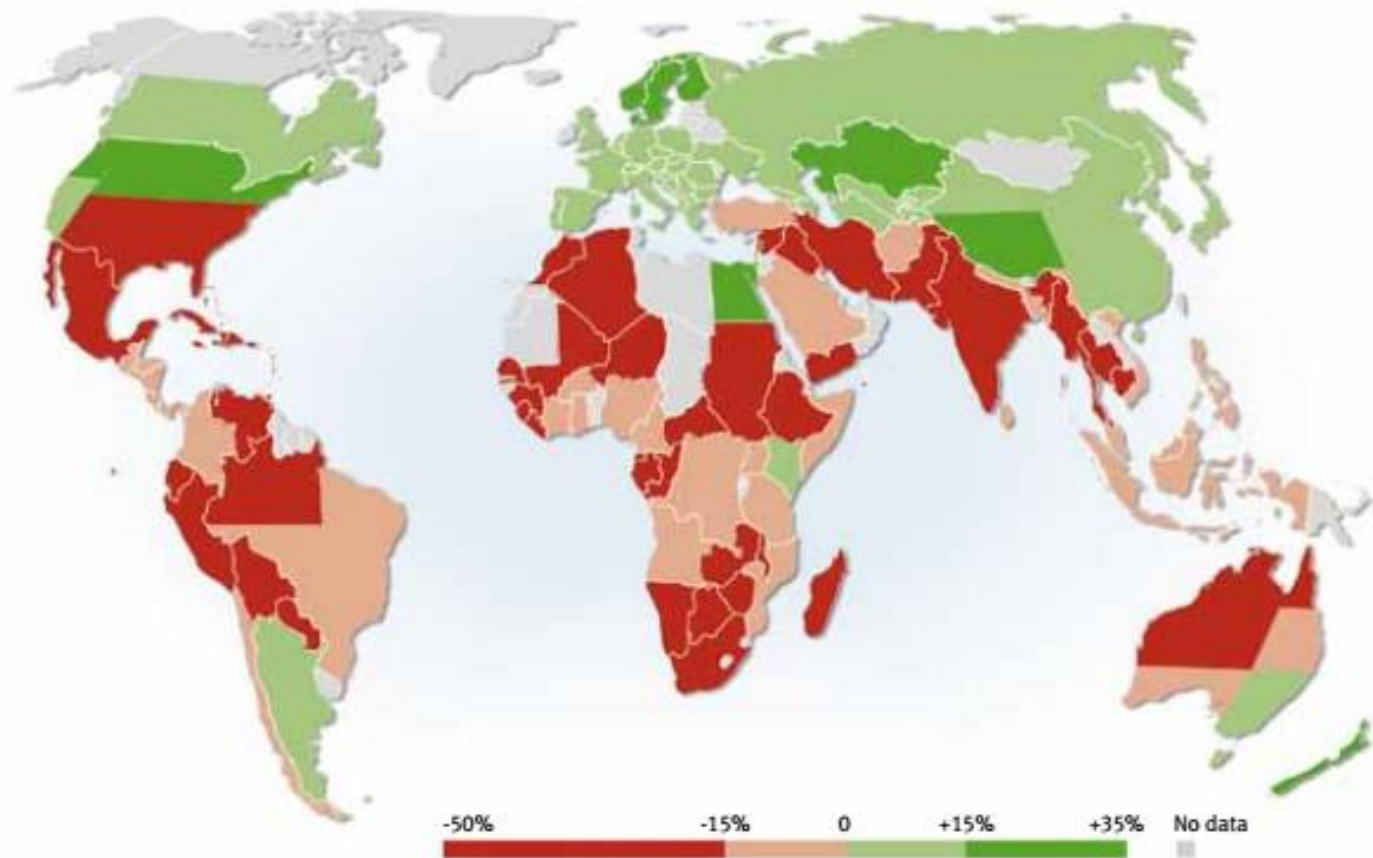

# We have but one planet .....

# Possible impact of climate change

Beddington

Hugo Ahlenius, UNEP/GRID-Arendal

**Figure 6. Projected changes in agricultural production in 2080 due to climate change.** Source: Cline. 2007. Projections assume a uniform 15% increase in yields due to the fertilization effect of rising carbon dioxide in the atmosphere on some plant species.

# Difference between fossil fuel and biomass

# Difference between fossil fuel and biomass

## Need of land

# When the population is increasing : doubling cropland

**Deforestation**

**+ 312 tCO<sub>2</sub>/ha**

**Forestland**

Mean average  
carbon stock  
in trees  
60tC/ha

**Grassland  
conversion**  
**+ 92 tCO<sub>2</sub>/ha**

**Grassland**

**Cropland**

Mean average carbon stock in soil organic

70tC/ha

45 tC/ha

**An average land use change  
(1/2 forest & 1/2 grassland)  
generates about 200 t of CO<sub>2</sub> per ha**

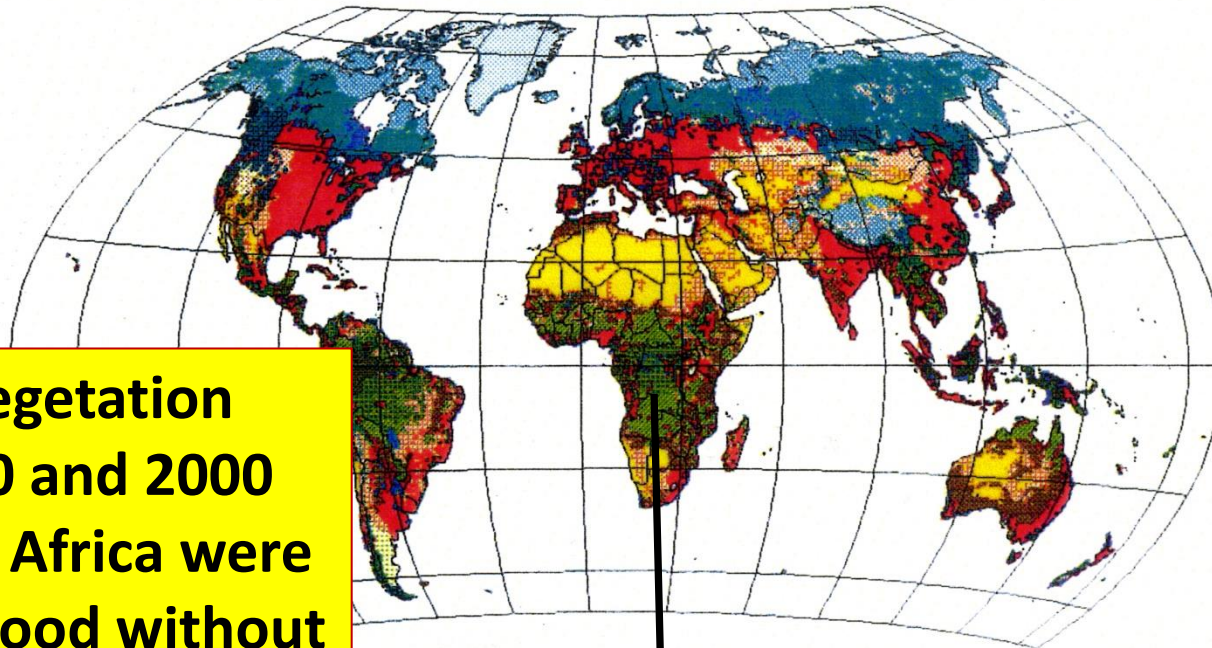

# We have but one planet .....

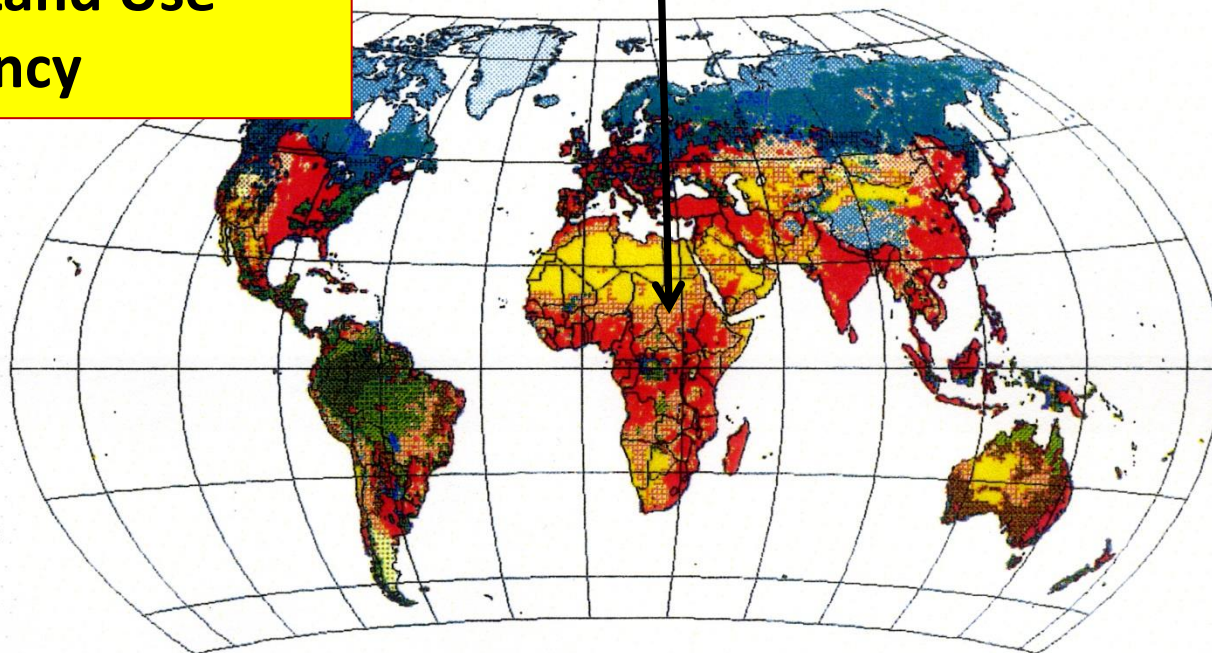

Actual Land Cover Types for year 1990

**Change in vegetation  
between 1990 and 2000  
if Sub-Saharan Africa were  
to produce its food without  
improving Land Use  
efficiency**

Actual Land Cover Types for year 2050

- Cool (semi)desert
- Hot desert
- Tundra
- Cool grass/shrub
- Warm grass/shrub
- Xerophytic woods/scrub
- Taiga
- Cool conifer forest
- Cool mixed forest
- Temp. deciduous forest
- Warm mixed forest
- Trop. dry forest/Savanna
- Trop. seasonal forest
- Trop. rain forest
- Wetlands

# When the population is increasing : doubling yields

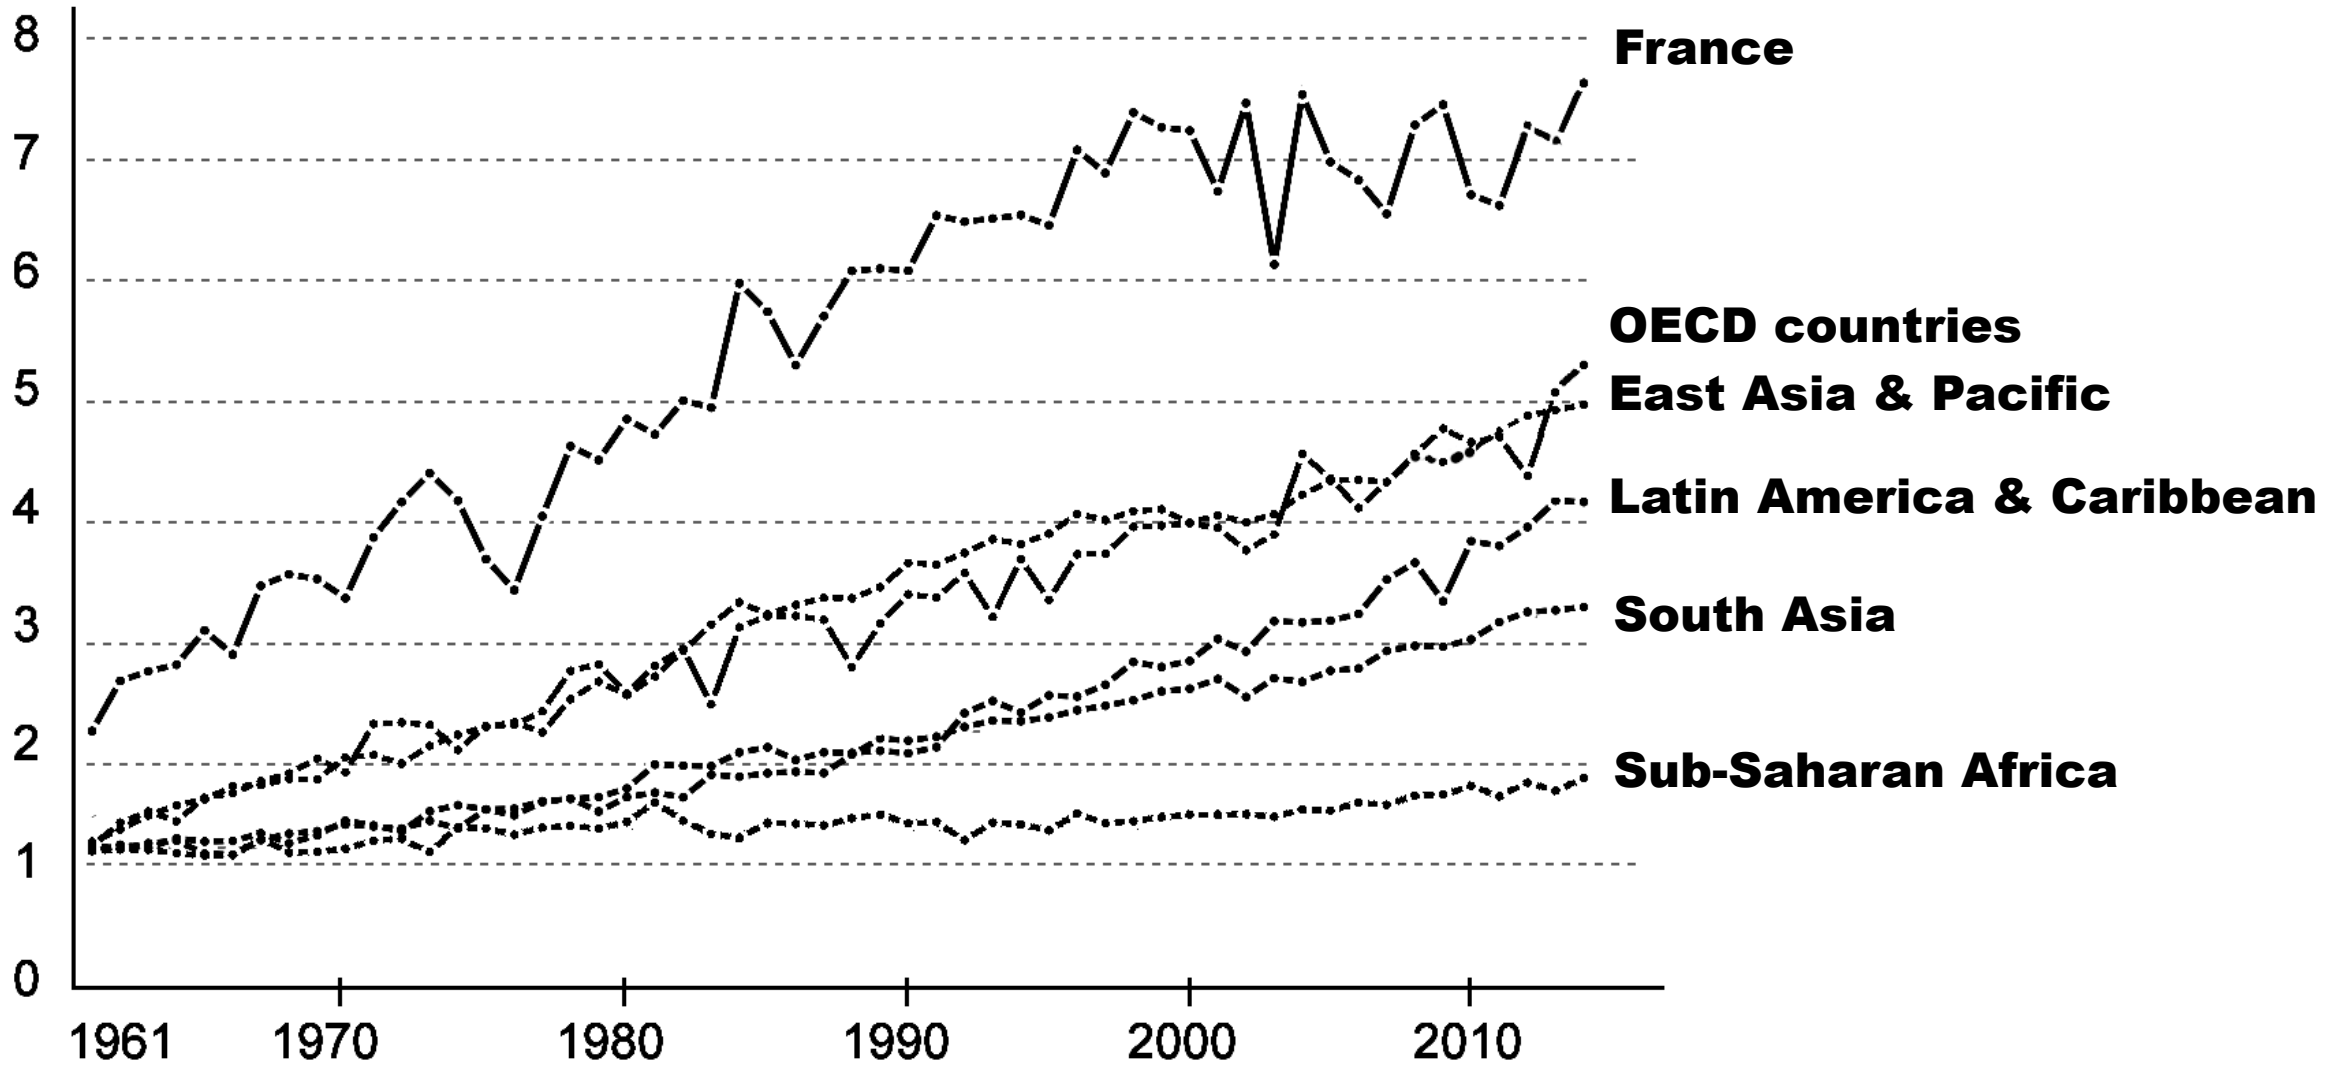

**From i to k**

**(k) : Doubling yields**

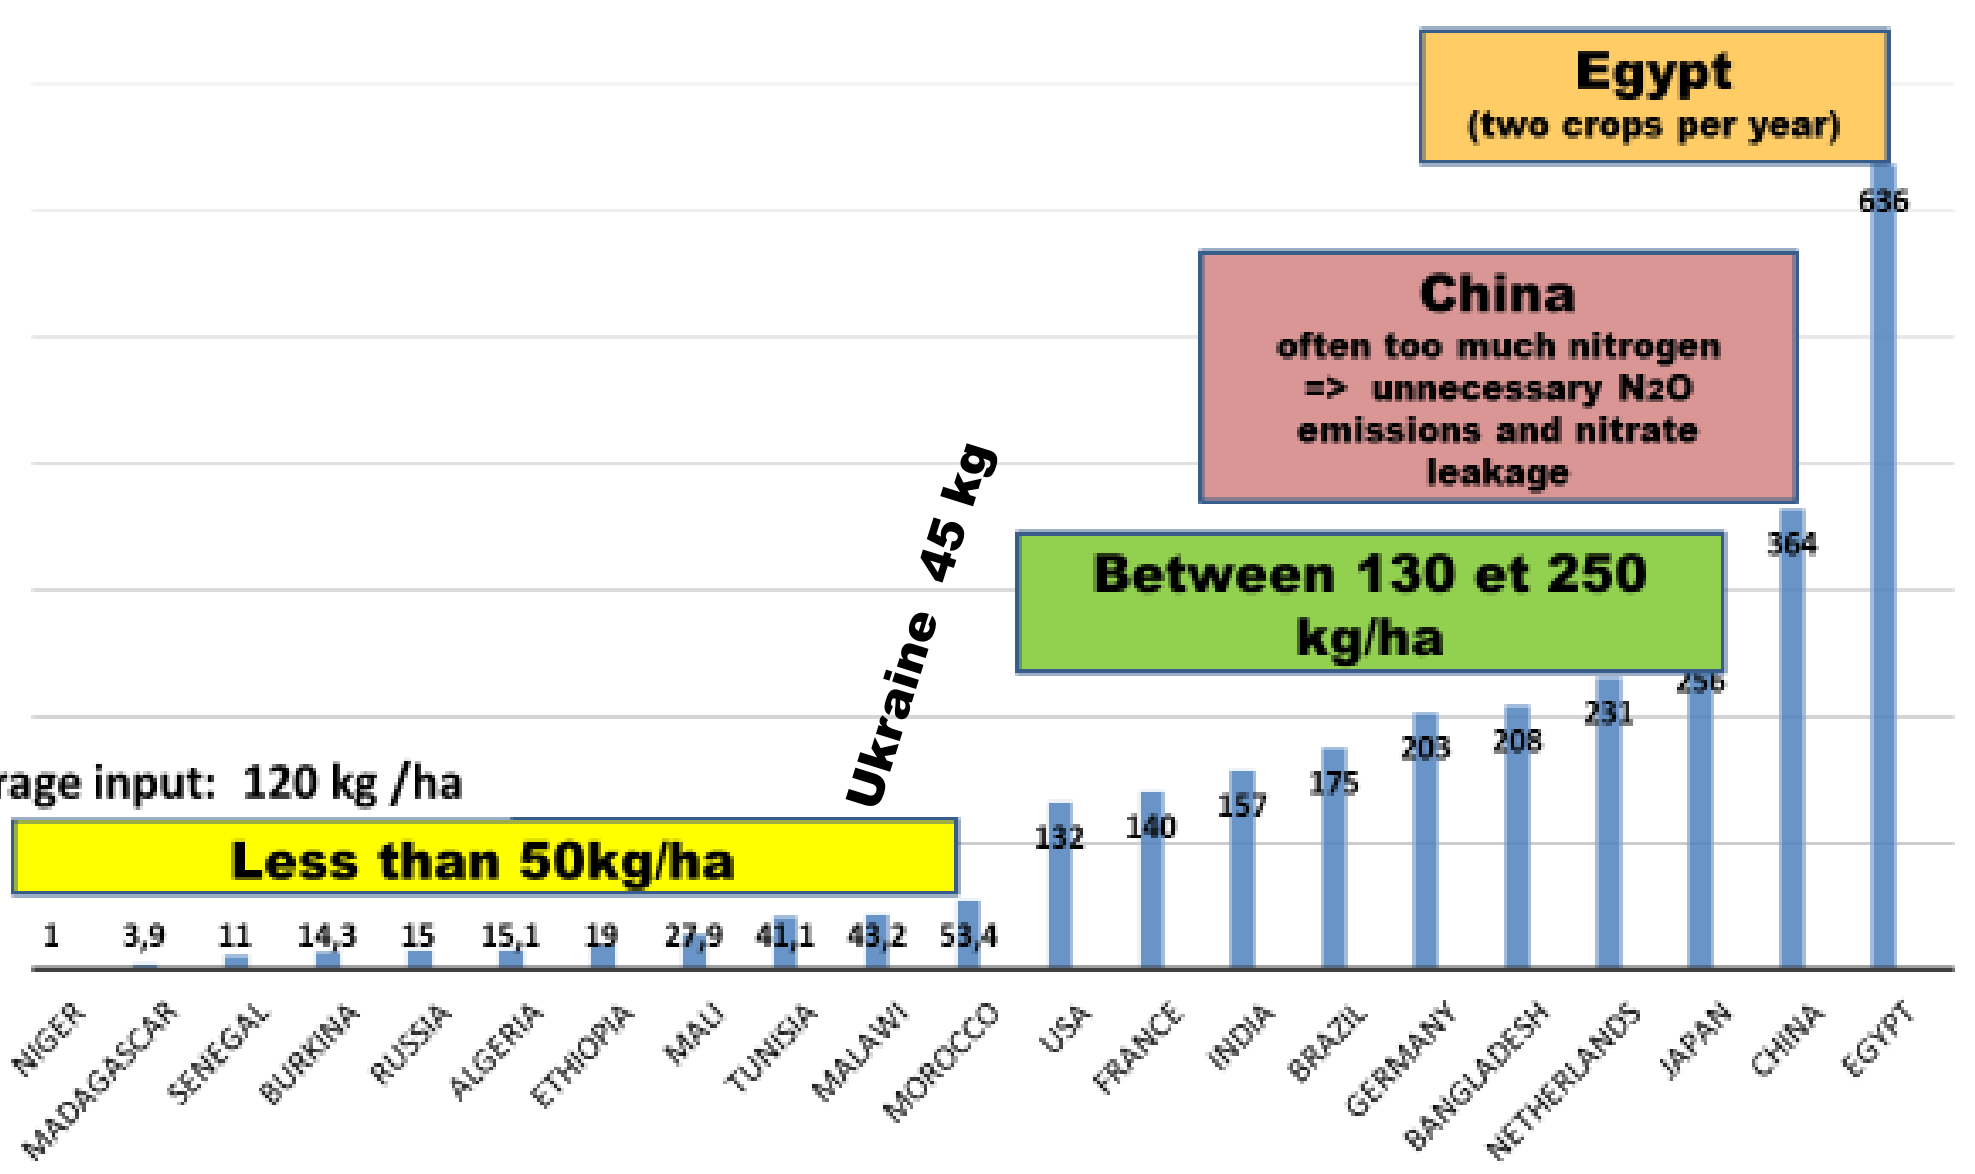

t/ha

t/t

World average input: 120 kg /ha

Less than 50kg/ha

Ukraine 45 kg

Between 130 et 250 kg/ha

China  
often too much nitrogen  
=> unnecessary N<sub>2</sub>O  
emissions and nitrate  
leakage

Egypt  
(two crops per year)

# IFDC 1991 and 2006 IPCC guideline

## FERTILIZER USE AT THE VILLAGE LEVEL: CONSTRAINTS AND IMPACTS

Summary Proceedings of Workshop

Lomé, Togo  
October 2-8, 1991

## Feeding Africa

## Africa Fertilizer Summit

9-13 June 2006 ▲ Abuja, Nigeria

**Can we increase Land Use efficiency without deteriorating the GHG budget ?**

**Deforestation**

**+ 312 tCO<sub>2</sub>/ha**

**Forestland**

Mean average  
carbon stock  
in trees  
60tC/ha

**Grassland**

**Grassland  
conversion  
+ 92 tCO<sub>2</sub>/ha**

**+ 2 tCO<sub>2</sub>e  
per ha per  
Year**

**Cropland**

Mean average carbon stock in soil organic

70tC/ha

45 tC/ha

**An average land use change  
(1/2 forest & 1/2 grassland)  
generates about 200 t of CO<sub>2</sub> per ha**

# What is land use efficiency ?

- **Not exactly yield**
- **The reverses of the Territorial Intensity  
(Lueff. = 1/ IT)**
- **IT is the total land needed to produce annually a  
unit of product**

1 ton of cereal  or Dry Matter or Protein

**Take into account fallow land, multiple cropping, intercropping, land to combat parasites etc.**

# Evolution of Territorial Intensity (TI) in France, between 1850 à 2000

**En 1850**

(agriculture préindustrielle et souvent encore aujourd'hui en Afrique sub saharienne )  
Rendement=0,86 t /ha

(Surface pour produire une tonne de céréale)

Surface cultivée

Jachère

**En 1950**

(agriculture au début du stade industriel)  
Rendement=1,59 t/ha

Surface pour les animaux de traits

**En 1970**

(agriculture industrielle à mi parcours )  
Rendement 3,18 t /ha

**En 2000**

(agriculture industrielle optimisée)  
Rendement= 6,37 t/ha

**Territorial Intensity  
divided by 9  
between 1850 et 200**

Riedacker 2008

# Evolution of GHG per ton of grain in France 1850 - 2000

1850

Surface  
cultivée

Jachère

1950

Surface pour les  
animaux de traits

1 CO<sub>2</sub>teq

1 teqCO<sub>2</sub>

1970

**GHG intensity divided by  
2 between  
1950 and 2000**

0,71 teqCO<sub>2</sub>

2000

**1 t => 0.5t CO<sub>2</sub>e  
per ton of grain**

0,49 teqCO<sub>2</sub>

# Evolution of fossil energy consumption per ton of grain in France 1850 - 2000

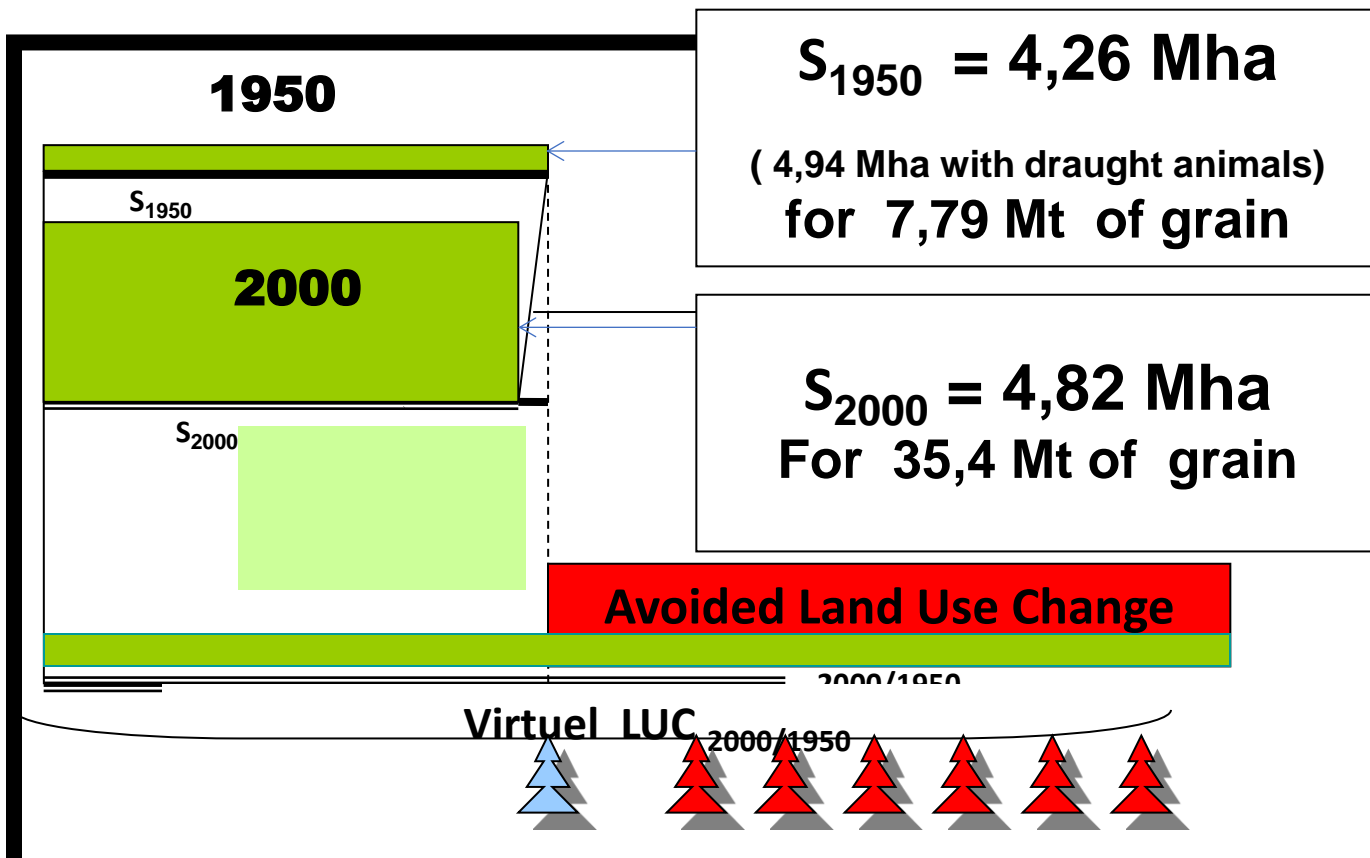

# Per additional ton of grain

**First increase land use efficiency  
(e.g. decrease IT) to limit GHG from LUC**

# Evolution in wheat production in France 1950 and 2000

**Avoided  
Deforestation  
Avoided Land  
Use Change  
 $A_{vLUC} \text{ }_{2000/1950}$   
 $\approx 14,4 \text{ Mha}$**

**Equivalent of the  
French forest  
area  
 $\sim 1/4 \text{ France}$**

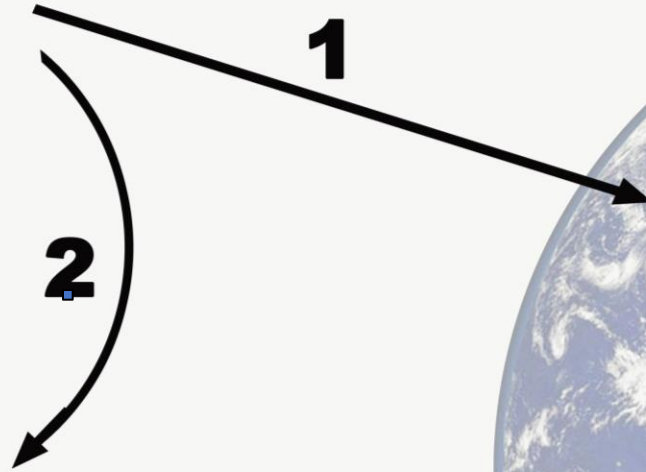

**Real Land Use Change between 1950 & 2000  $\approx 0$**

**Land Use for grain production of 2000  
with of TI  $_{1950} = 19,33 \text{ Mha}$**

**Net increase of annual energy gain  
9.8 Mtoe (grain) &  $\sim 7,8 \text{ Mtoe}$  (straw)  
Avoided GHG emissions between  
2000 / 1950 in billion tCO<sub>2</sub>  
4,5 (forest) / 2,88 (mix forest grassland)**

# For National and Global Sustainable Development

## The new constraints

- 1/Availability of arable land
- 2/ Climate change ( mitigation and adaptation)
- 3/Fossil energy
- 4/ Capital
